

Motors for Hazardous Areas

D5 SERIES

MarelliMotori is part of the FKI group of companies serving the world in the sectors of power generation, transmission and distribution. With over one hundred years of experience, MarelliMotori is a name synonymous with Quality and Manufacturing Excellence in the production of rotating machines.

MarelliMotori is recognised as a leading supplier to the Industrial, Petrochemical and Marine sectors, offering a complete range of standard and custom solutions for low and medium voltage motors and generators.

Our products are backed by an organisation of skilled people dedicated to providing the high standard of design, sales, service and technical support demanded by our customers. Our ability to offer flexible and rapid solutions is an integral part of achieving MarelliMotori's goal of Total Customer Satisfaction.

GENERAL ASPECTS OF THE ATEX DIRECTIVE

The directive 94/9/EC, better known as ATEX from the French term Atmosphères EXplosibles, is a European Community Directive, which defines the minimum health and safety requirements for apparatus intended for use in potentially dangerous environments. The directive is adopted by the European Union (EU) to facilitate free trade in the EU of products to which the Directive applies.

It conforms to the safety demands in essence by:

- The application of harmonised specific standards,
- The EC-type examination of products from a notified body, resulting in the appropriate certification,
- The manufacture of the product under a quality management system approved by a notified body.

In order to use electrical equipment in a potentially explosive atmosphere, such as combustible air – gas mixtures or combustible or conductive dust, the environment must first be classified in accordance with standard EN 60079-10 and with its related guide.

The classification, carried out by qualified competent professionals, identifying:

- the group of equipment,
- the category,
- the protection method,
- the temperature class, or the maximum surface temperature

characteristics of the electrical motors to be used in this application.

DANGEROUS AREAS

The dangerous environments are classified into **zones**, shown in the following scheme:

Gas	Dust	Presence of potentially explosive atmosphere
Zone 0	Zone 20	Always present, frequent or lasting long periods during normal operation. The use of electric motors is not allowed.
Zone 1	Zone 21	Incidental presence: likely to occur during normal operation of the equipment.
Zone 2	Zone 22	Accidental presence: unlikely to occur during normal operation of the equipment.

GROUPS

The electrical apparatus is subdivided into two **groups** (EN 50014), according to the environments in which the equipment will operate.

Group	I	II
Environment	Used in subterranean mines and on the surface of mines in the presence of firedump and/or combustible dust.	Explosive atmospheres other than mines; surface industries.

CATEGORIES

Each group is classified into **categories**, according to the level of protection the apparatus must have:

Group I	Category	M1	M2
	Level of Protection	Very high	High
	In the presence of explosive atmosphere	The apparatus must remain operative	The electrical supply to the equipment must be interrupted

Group II	Category	1	2	3
	Level of Protection	Very high	High	Normal
	Presence of explosive atmosphere	High probability (always, often, for extended periods)	Probable	Low probability (rare and for a short time)
	Zones in which the equipment may be fed and may operate	0, 1, 2 and/or 20, 21, 22	only 1, 2 and/or 21, 22	only 2 and/or 22

The equipment belonging to group II is also specified by the **nature of the atmosphere** and can be arranged into the following categories:

G = mixture of air and gas, vapour or mist

D = mixture of air and combustible dust

Gas atmospheres are further divided into three sub – groups, according to the nature of the gas:

Group	Examples of some substances
II A	acetone, acetic acid, methanol, ethanol, benzene, ethane, methane, propane, toluene, xylene, combustible oil, kerosene, acetaldehyde, ethylbenzene, isoprene.
II B	coke-oven gas, ethylene, ethylene oxide, ethyl ether, formic aldehyde.
II C	hydrogen, acetylene, water gas, carbon sulphur.

A motor belonging to a particular group is also suitable for use in a lower group (e.g. a motor used in group IIB is also suitable for group IIA).

TYPES OF PROTECTION

The EN 60079-10 standard classifies the dangerous areas, while the standard EN 60079-14 defines the compatibility between the protection method with the aforementioned dangerous zones. The types of protection are defined as follows:

For mixtures of air and gas, vapour or fog	For mixtures of air and dust
“d” - Flameproof enclosures (EN 50018)	IP y5 + maximum permitted surface temperature (y=6 for category 2D; y=5 for category 3D). Electrical apparatus intended for use in environments with the presence of combustible dust. (EN 50281-1-1). When only this method of protection is requested, it is not necessary for the motors to be explosion proof, but in addition to the grade of protection mentioned above, they must have a maximum surface temperature limited to a specified value.
“e” - Increased safety (EN 50019)	
“n” - in accordance with standard EN 50021	

TEMPERATURE CLASS

See definition on page 4: “Maximum surface temperature”.

DEGREE OF PROTECTION IP56

Motors of Category 2G operating at a maximum ambient temperature of 40°C can be supplied on request with IP56 protection degree under the following temperature class:

- 2 pole motors: temperature class T3
- ≥ 4 pole motors: temperature class T3, T4

DEFINITIONS

The present catalogue lists motors for use in potentially explosive atmosphere, relative to:

- Group I - Category M2, for motor sizes 160-315;
- Group II - Category 2G, 2D.

EXPLOSIVE ATMOSPHERE

Is a mixture of flammable substances in the state of gas, vapour, mist and dust:

- with air,
- in which, after ignition, combustion spreads throughout the unconsumed mixture.

POTENTIALLY EXPLOSIVE ATMOSPHERE

It is an atmosphere which could become explosive either as a result of local and/or operating environmental conditions. The ATEX directive applies to products for use in this environment.

TYPE OF PROTECTION “d”

The electrical equipment has an enclosure suitable to:

- resist the internal pressure arising from the ignition of an explosive mixture within the equipment.
- avoid the transmission of the explosion to the external atmosphere in which the equipment is being used.
- ensure that the maximum external surface temperature is maintained within the limits specified by the temperature class of the equipment.

TYPE OF PROTECTION – INCREASED SAFETY “e”

A type of protection in which additional measures are applied so as to give increased security against the possibility of

- excessive temperature,
- the occurrence of arcs and sparks both inside and on external parts of electrical apparatus which does not produce arcs or sparks in normal service.

COMBINED TYPE OF PROTECTION “de”

Combines the essential requirements of protection types “d” and “e” (in accordance with standards EN 50018 and EN 50019) specifically:

- motor enclosures with protection “d” (in accordance with standard EN50018);
- terminal boxes with increased safety “e” (in accordance with standard EN 50019).

COMBINED CATEGORY 2G/2D

Combines the essential safety requirements:

- of protection type “d” (in accordance with standard EN50018),
- of the protection mode for electrical apparatus intended for use in environments with the presence of combustible dust, protection degree IP65 (EN50281-1-1).

MAXIMUM SURFACE TEMPERATURE

It is the maximum operating temperature reached in the most unfavourable conditions (but within relative limits) on the surface of the electrical apparatus. For equipment of group I, the maximum surface temperature must not exceed 150°C.

The following table is relevant to apparatus of category 2G, which is based on a predetermined temperature classification:

Temperature class	T1	T2	T3	T4	T5	T6
Maximum Surface Temperature (°C)	450	300	200	135	100	85

The maximum surface temperature is:

- the temperature of the external surfaces, for motors with protection mode “d”,
- the temperature of the external surfaces and of the internal points of the terminal box, for motors with protection mode “de”

In a potentially explosive atmosphere, the maximum surface temperature of the equipment must remain lower than the lowest possible spontaneous ignition temperature of the atmosphere surrounding it.

Electrical apparatus of category 2D are classified based on maximum surface temperature. This catalogue applies to motors having either of the following three maximum surface temperatures: T 150°C, T 135°C and T 100°C. In the case of atmospheres with combustible dust, the maximum permitted surface temperature depends on: the type of dust, the thickness of the layer of dust and on a safety factor used according to (EN 50281-1-2).

Motors of category 2G can also be used in installations requiring apparatus in category 3G, provided that they comply with the specified temperature class. Likewise, category 2D motors can be used in category 3D installations requiring the same or a higher maximum surface temperature.

MARKINGS

According to the 94/4/EC Directive, motors come with 3 markings giving the indispensable indications to safely use the product. These indications let the user check the compatibility between the protection mode of the motor and the classification of the area of its installation.

The data shown on the nameplate must therefore contain, in addition to the functional information, the 3 markings described below in sequence (CE, specific and supplementary) and the reference to the notified body in charge of the certification.

CE MARKING

The CE marking indicates that the D5 series motor conforms to all the applicable directives (and specifically to the ATEX directive).

It is a declaration of the manufacturer that the product conforms to the applicable directives and that the product conforms to the prototype on the basis of the quality check procedures it was submitted to.

The conformity procedure for the apparatus with respect to categories M2 and 2 demands for:

- EC-type examination released by a notified body (that issues the relative certification);
- product quality assurance (the product must be manufactured under a quality system which was valued and approved by a notified body).

MARKING SPECIFIC TO THE PROTECTION FROM EXPLOSIONS

In accordance with the 94/4/EC directive and EN 50014 standard, the apparatus must be supplied with the markings specific to protection from explosions:

Symbol  + GROUP (I or II) + CATEGORY (M2 or 2) + (only for group II) letter G (Gas) and/or D (dust)

SUPPLEMENTARY MARKING

The supplementary marking, in accordance with the 94/4/EC directive and to the EN 50014 standard, uses the following symbols:

EEx	indicating that the product conforms to one or more protection types, subject to the specific European standards;
d, e,	type of protection;
I, II,	equipment group with sub-group of gas for group II
T3,	temperature class (for category 2G) or maximum surface temperature (for category 2D).
IP65	protection degree of the motor enclosure for category 2D.
T xxx°C	maximum surface temperature for motors of category 2D and 3D.

NOMENCLATURE OF THE D5 SERIES MOTORS

The D5 series motors are divided into the following types:

Series ⁽¹⁾	Specific Marking			Supplementary Marking			Polarity		Supply		Frame size where applicable
	Ex	Group	Category	Protection	Group	Temperature Class (Maximum surface temperature)	single	doublet	mains	inverter	
D5C		II	2G	EEx d	II B	T3, T4, T5	X		X		71 - 400
D5D ⁽³⁾								X	X		
D5X		II	2G	EEx de	II B	T3, T4, T5	X		X		71 - 400
D5E ⁽³⁾								X	X		
D5F		II	2G	EEx d	II B	T3, T4	X			X	71 - 400
D5S				EEx de			X			X	
D5K		II	2G	EEx d	II C	T3, T4	X		X		160 - 315
D5Y								X	X		
D5R		II	2G	EEx d	II C	T3, T4	X			X	160 - 315
D5V				EEx de			X			X	
D5T		I	M2	EEx d,	I		X		X	⁽⁴⁾	160 - 315
D5U				EEx de				X	X		
D5A		II	2D	IP 65		(T 150°C) (T 135°C) (T 100°C)	X		X	⁽²⁾	71 - 400
D5B ⁽³⁾								X	X		

1: Series name of combined category 2G/2D motors = Series name of category 2G motors.

2: The D5A motors can be supplied on request for frequency converter application with maximum surface temperature of T135°C or T150°C.

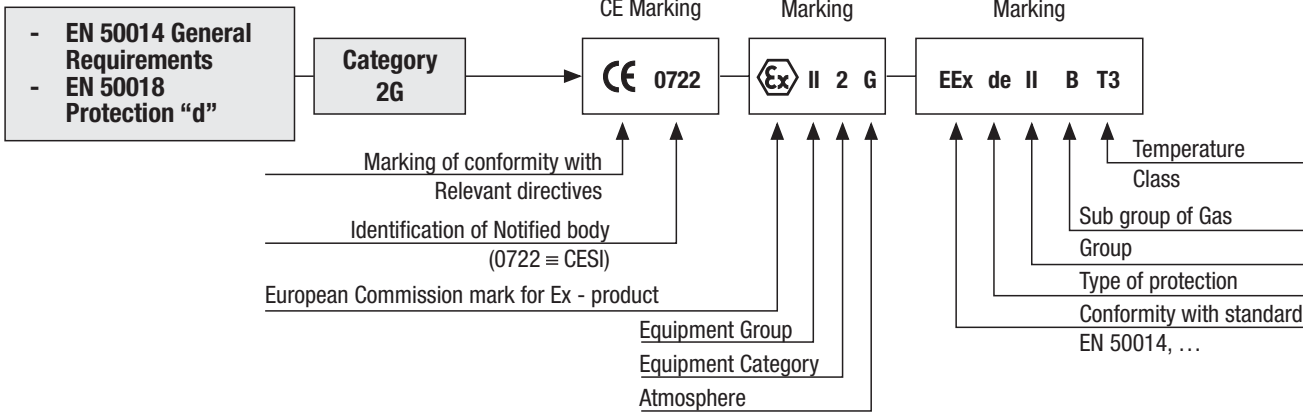

3: Motors available with Temperature Class T3 (D5D, D5E) and Maximum Surface Temperature T150°C (D5B).

4: The D5T motors can be supplied on request for frequency converter application with temperature Class T3.

EXAMPLES OF MARKINGS

The following indicates some examples of markings for D5 series motors

D5X series.

D5X series.

D5T and D5U series.

D5A and D5B series.

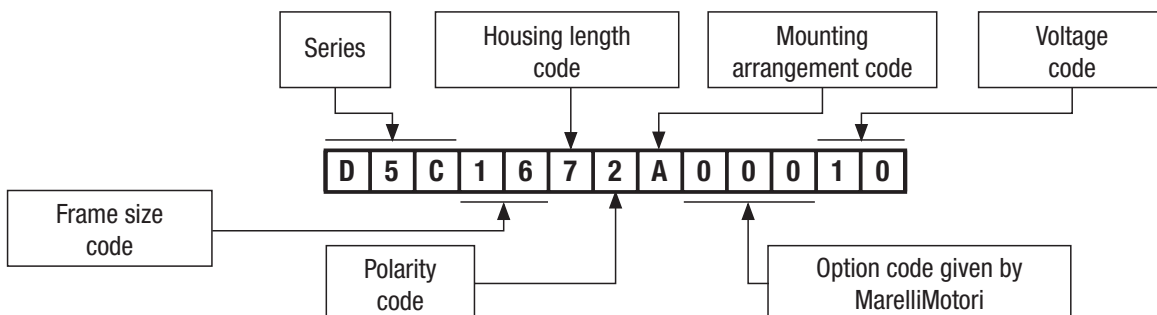

D5C series - Combined category

PRODUCT CODE STRUCTURE

MarelliMotori products are identified by 13 digit code show on the nameplate. The code is constructed as follows.

MOUNTINGS AND POSITIONS

Motors are supplied according to type of construction B3, B5, B3B5, B14, B3B14 and V1 compatible with the mounting arrangements shown in table below as defined in IEC 60034-7. Nameplates are marked with the abovementioned type of construction.

Code I	Code II		71 - 112	132	160 - 250	280 - 315	355 - 400

- 1) Motors with feet
- 2) Flanged motors: unthreaded through holes
- 3) Flanged motors: threaded dead holes
- Standard
- X Consults MarelliMotori

Motors from frame size 71 and above are supplied with lifting eye bolts displaced according to type of construction B3 whereas they will be displaced according to type of construction V1 only if provided with antirain canopy.

MATERIALS

The mechanical components used in D5 series motors are made of the materials shown in the table below:

Components	Size					
	71 - 132	160 - 280	315		355 - 400	
			2 - 6 poles	≥ 8 poles	2 - 4 poles	≥ 6 poles
Frame	Cast Iron	Cast Iron (*)			Steel	
Endshields						
Fan cowl	Aluminium Alloy	Steel				
Fan	Thermoplastic (**)			Metal		
Terminal Box	Cast Iron			Steel		

(*) Steel for EEx d IIC motors.

(**) Metal is used for motors of M2 category.

BALANCING AND VIBRATION GRADES

The motors are dynamically balanced with a half key applied to the shaft extension in accordance with standard EN 60034-14 to vibration grade normal (N) in standard configuration.

Larger vibrations may occur on motors installed at site, due to various factors such as unsuitable foundations or resonance with the driven system. In such cases additional checks should also be carried out on each element of the installation.

Motors can be supplied with reduced (R) or special (S) vibration level on request.

The following table indicates the maximum vibration limits with respect to the different shaft heights

Vibration grade	Rated speed (min ⁻¹)	Maximum rms value of vibration speed for shaft height H in mm. [mm/s].		
		71 ≤ H ≤ 132	132 < H ≤ 225	250 < H ≤ 400
N normal	600 - 3600	1,8	2,8	3,5
	600 - 1800	0,71	1,12	1,8
R reduced	> 1800 - 3600	1,12	1,8	2,8
	600 - 1800	0,45	0,71	1,12
S special	> 1800 - 3600	0,71	1,12	1,8
	600 - 1800	0,45	0,71	1,12

The instrumentation can have a measurement tolerance of ±10%.

NOISE

The following table shows the medium values of A-sound pressure level (LpA) for group IIB motors, measured at a one-metre distance according to standard ISO R 1680. The sound levels are measured with the motor running at 50 Hz, in no-load conditions and have a tolerance of 3 dB(A). At 60 Hz the values of sound pressure increase by approximately 4 dB(A).

Frame size	A-sound pressure level (LpA) [dB(A)]			
	2 poles	4 poles	6 poles	8 poles
	LpA	LpA	LpA	LpA
71	60	53	-	-
80	67	53	53	53

250	84	74	66	63
280	84	77	72	72
315 SM	83	78	74	74
315 M	83	78	74	74
355	82	79	75	70
400	82	81	76	73

BEARINGS

The theoretical lifetime of bearings, L10h according to ISO 281/1 standard, of standard horizontal construction motors, without external forces (radial and/or axial) is in excess of 50,000 hours.

The lifetime of bearings is determined by multiple factors and specifically by:

- the external loads and level of vibration
- the lifetime of the grease (mainly on double screen bearings),
- the environmental conditions and working temperature.

Motors with frame sizes from 71 to 132 in standard configuration have double screen prelubricated ball bearings.

The correspondent grease life under normal operating conditions for a motor with horizontal shaft, running at 50 Hz and at maximum ambient temperature of 40°C is:

- 10,000 hours in continuous duty for 2 pole motors,
- 20,000 hours in continuous duty for 4 pole motors.

The axial positioning of the rotor is carried out by means of a preload washer at the N-end, as shown in the diagram to the right.

The following table describes the bearing types used on the different frame sizes.

Frame Size	D-End (*)	N-End (*)
71	6202-2Z	6202-2Z
80	6204-2Z	6204-2Z
90	6205-2Z	6205-2Z
100	6206-2Z	6206-2Z
112	6206-2Z	6206-2Z
132	6308-2Z	6308-2Z

(*) Different types can be supplied on D5A and D5B series motors.

Category 2G group IIB motors from 160 to 315 frame size in standard configuration are equipped with:

- single screen prelubricated ball bearings (160 - 250 without regreasing system; 280 - 315 with regreasing system) for group IIB; 160 - 250 frame motors can be supplied with regreasing system and the relative grease exhausts on request. The N-end bearing is axially preloaded by means of a preload washer.
- D-end roller bearing (except for 2 pole motors) and N-end ball bearing for group IIC motors.

Frame Size	Group I M2 and IIB				Group IIC			
	D-End (*)		N-End (*)		D-End (*)		N-End (*)	
	Horizontal	Vertical	Horizontal	Vertical	Horizontal	Vertical	Horizontal	Vertical
160-180M	6310-Z-C3		6209-Z-C3		NU 210 E-C3		6209-2Z-C3

280 ≥ 4 poles	NU2217-EC-C3		6314-Z-C3		NU2217-EC-C3		6314-C3	
315 - 2 poles	6316-C3		6316-C3		6316-C3		6316-C3	
315 ≥ 4 poles	NU2219-EC-C3		6316-C3		NU2219-EC-C3		6316-C3	

(*) Different types can be fitted with series D5A and D5B motors.

Motors from 355 to 400 frame size in standard configuration are equipped with regreasable rolling bearings.

The supports are equipped with grease nipples. In standard configuration, the rotor is axially fixed on the N-End side.

MOUNTING ARRANGEMENT B3 - IM1001

Frame Size	Poles	D-End	N-End
355 ÷ 400	2	6217 - C3	6217 - C3
355	≥ 4	NU 222 - C3	6217 - C3
400	≥ 4	NU 222 - C3	6222 - C3

MOUNTING ARRANGEMENT V1 - IM3011

Frame Size	Poles	D-End	N-End
355 ÷ 400	2	6217 - C3	7217 B
355	≥ 4	NU 222 - C3	6217 - C3 + 7217 B
400	≥ 4	NU 222 - C3	6222 - C3 + 7222 B

For different bearing configurations contact MarelliMotori.

LUBRICATION INTERVALS

The following table indicates the lubrication intervals of motors without regreasing system in standard configuration and the relubrication intervals of motors with regreasing system in standard configuration.

The shown values refer to normal operating conditions at a maximum ambient temperature of 40°C.

Motors without regreasing system - Group IIB

Frame Size	Lubrication Interval (H)							
	3600 min ⁻¹	3000 min ⁻¹	1800 min ⁻¹	1500 min ⁻¹	1200 min ⁻¹	1000 min ⁻¹	900 min ⁻¹	750 min ⁻¹
160 - 180	7000	7500	12000	14000	16000	18000	21000	26000
200	5500	7000	11000	12000	14000	16000	18000	23000

250	1200	1500	2400	2800	3600	4400	4500	5500
280	3200	4000	2000	2200	2800	3400	3800	4600
315	2800	3400	1700	2000	2600	3000	3400	4200

TERMINAL BOX AND CABLE ENTRANCE

Motors from 71 to 132 frame size have main terminal box on the right side (when seen from D-end, B3 mounting) and are normally equipped with 6 terminals. The terminal box can be rotated in steps of 90°.

Frame Size	Type of terminal	Terminal thread	Cable entrance holes
71 ÷ 90	Threaded terminals	M6	M25 x 1,5
100 ÷ 132	Threaded terminals	M6	M32 x 1,5

Motors from 160 to 400 frame size have the main terminal box on top (B3 mounting) and are normally equipped with 6 terminals. The terminal box can be rotated in steps of 90°.

Frame Size	Type of terminal	Terminal thread	Cable entrance holes
160 - 200	Threaded terminals	M6	M40x1,5 + M40x1,5 ⁽¹⁾
225 - 250	Threaded terminals	M8	M50x1,5 + M50x1,5 ⁽¹⁾ + M20x1,5 ⁽¹⁾
280 - 315	Threaded terminals	M12	M75x1,5 + M75x1,5 ⁽¹⁾ + M20x1,5 ⁽¹⁾
355 - 400	Threaded terminals	M20	M75x1,5 + M75x1,5

(1) Closed with a certified plug, in accordance with Directive 94/4/EC, when not used.

PROTECTIVE TREATMENTS

EXTERNAL SURFACES

The **standard painting process** consists of the application of epoxy-vinyl/polyurethane paint: the surface treatment, material and paint thickness make D5 series motors suitable for use in standard industrial environments.

A **special painting process**, consisting of epoxy-vinyl paint followed by polyacrylic paint is available on request. This process is particularly recommended for:

- aggressive environments;
- outdoor installations where salt is present or environments with the presence of anhydric gases;
- marine installations;

The standard finishing colour is RAL 5010. Other RAL and MUNSSELL colours are available on request.

Description	Process	Characteristics	Thickness
Painting	Standard	Two-component paint formulated with solid epoxy resins modified with vinyl polyamide catalysers	≥ 50 μm
	On request	Std + additional polyacrylic coat formulated with an aromatic semialiphatic catalyser	≥ 200 μm
Finishing paint	Standard	RAL 5010	
	On request	RAL & MUNSSELL colours	

INTERNAL SURFACES

The internal parts of the motors are treated with an insulating enamel to prevent motor corrosion due to humidity and aggressive substances. Such treatment added to the impregnation of active parts is an essential requirement for motors intended for use in industrial, tropical-humid environments.

THERMAL PROTECTIONS

The motors must be protected against overload by setting the omnipolar timer to time inversion (EN 60079-14) (timer not scope of MarelliMotori supply). The motors can however be equipped with additional thermal protections which characteristics are given in the following table.

Additional built-in thermal protections		
Type	Operating principle	Frame sizes where applicable
Bimetallic devices	Motoprotectors with contacts Normally Closed. The disc opens when the winding temperature reaches limits dangerous to the insulation system of the motor.	90÷400
(Positive Temperature Coefficient) Thermistors PTC	At the active temperature this device quickly changes its resistance value.	90÷400
Platinum resistance thermometers PT100	Variable linear resistance with the winding temperature, particularly suitable for a continuous winding temperature monitoring.	160÷400

The intervention temperature of the thermal protection to be selected is dependent on the temperature class and/or on the allowed maximum surface temperature. D5 series motors from frame size 160 and above in standard configuration have 3 PTC with terminals in the main terminal box.

All motors for frequency converter application must be equipped with PTC having suitable intervention temperature.

In this case, the connection between the temperature-sensitive element to the dedicated protection equipment (not scope of MarelliMotori supply) is mandatory and the control must be set, so that the motor can be used only when the thermal protection equipment is operative.

The use of the motor is dependent on the state of the thermal protections.

GROUNDING

All motors are equipped with two grounding terminals, one inside the terminal box and one outside. Both are dimensioned for connection to suitable earthing wires conforming to EN 50014 standard.

COUPLING

Elastic or flexible couplings must be properly done to avoid the transmission of axial and/or radial loads to the motor shaft and bearings. For possible external axial and/or radial loads contact MarelliMotori.

ANTICONDENSATION HEATERS

Motors subject to atmospheric condensation, either through standing idle in damp environments or because of wide ambient temperature variations, may be fitted with anticondensation heaters. They are normally switched on when the supply to the motor is interrupted, heating the motor to avoid water condensation. Normal feeding voltage is 230V.

Motors from frame size 100 and above can be supplied with anticondensation heaters with terminals in main terminal box or, from 160 frame size and above of category 2G and of category 2D, with terminals in a separate terminal box. The power values normally used are shown in the table below.

Frame Size	Power (W)
100 - 112	8
132	25
160 - 180	50
200 - 250	65
280	100
315	200
355	300
400	400

CONDENSATION DRAINAGE

Motors of category 2G from frame size 160 and above can be supplied on request with condensation drainage holes. This option is advisable, for example, in environments with high humidity levels and large ambient temperature variations.

The following table shows some possible configurations of D5 series motors.

Frame Size	Type of Protection	PTC (n°3)	PT100 (n°3)	Anticondensation Heaters	PTC+Heaters	PT100+Heaters
90	d	opt				
	de					
100 - 132	d	opt		opt	opt	
	de	opt		opt		
160 - 250	d	std	opt		opt

VOLTAGE AND FREQUENCY

The motors described in this catalogue, if not otherwise specified, are designed to operate under feeding voltage of 230V/400V 10% - 50Hz. They are therefore suitable for use on the following supply voltages:

- 220/380V 5%, 50Hz
- 230/400V 5%, 50Hz
- 240/415V 5%, 50Hz

according to standard 60034-1, zone A.

The motors can be supplied with different voltages and frequencies on request.

OUTPUTS AND DERATINGS

The output ratings listed in this catalogue refer to continuous duty S1, rated voltage and frequency, ambient temperature between -20°C and +40°C and altitude up to 1000 m. a.s.l. In different environmental conditions the output ratings of temperature-class-T3 motors can be obtained by applying the derating factors given in the following table:

Altitude	Ambient temperature (°C)				
	40	45	50	55	60
1000	1,00	0,96	0,92	0,87	0,82
1500	0,97	0,93	0,89	0,84	0,79
2000	0,97	0,90	0,86	0,82	0,77
2500	0,90	0,86	0,83	0,78	0,74
3000	0,86	0,82	0,79	0,75	0,70
3500	0,82	0,79	0,75	0,71	0,67
4000	0,77	0,74	0,71	0,67	0,63

EFFICIENCY AND POWER FACTOR

The efficiency (η) and power factor ($\cos \varphi$) values referred to rated output are given in the technical data tables for each motor. The values for other loads can be estimated from the following tables.

Efficiency ($\eta\%$) and power factor ($\cos \varphi$)							
4/4		3/4		2/4		1/4	
η	$\cos \varphi$	η	$\cos \varphi$	η	$\cos \varphi$	η	$\cos \varphi$
97	0,91	97	0,88	96	0,82	92	0,64
96	0,90	96	0,87	94,5	0,80	90	0,63
95	0,89	95	0,86	93,5	0,79	88	0,60
94	0,88	93,5	0,85	92	0,78	86	0,58
93	0,87	93	0,84	91	0,77	85	0,57
92	0,86	92	0,83	90	0,75	84	0,55
91	0,85	91	0,82	89	0,73	82	0,53
90	0,84	90	0,81	87	0,72	90	0,51
89	0,83	89	0,80	86	0,70	79	0,49
88	0,82	88	0,78	85,5	0,67	78,5	0,47
87	0,81	87	0,76	85	0,66	78	0,45
86	0,80	86	0,75	84,5	0,65	77,5	0,43

66	0,61	65,5	0,53	63	0,36	53,5	0,23
64	0,60	63,5	0,52	61	0,35	52	0,22
62	0,59	61,5	0,51	59	0,34	49	0,21
60	0,58	59,5	0,50	57	0,33	47,5	0,20

ELECTRICAL TOLERANCES

Electrical tolerances in accordance with standard IEC 60034-1.

Power factor	-1/6 of (1-cosφ)	min. 0,02 max. 0,07	Locked rotor current	+20%	of guaranteed value
Efficiency	-15% of (1-η) -10% of (1-η)	P _n ≤ 50 kW P _n > 50 kW	Locked rotor torque	-15% +20%	of guaranteed value
Speed	± 20% ± 30% of guaranteed slip	P _n ≥ 1 kW P _n < 1 kW	Pull out torque	-10%	of guaranteed value

MECHANICAL TOLERANCES

Tolerances according to IEC 60072-1 are shown in the following table.
The second shaft extension is built only on request.

Part	Dimension	Tolerance
Shaft Extension	D-DA	from 11 to 28mm ø j6 / 38 to 48mm ø k6 / 55 to 100mm ø m6
Key	F-FA	h9
Flange Concentricity	N	up to frame size 132 j6 / greater than 132 h6
Shaft Height	H	up to frame size 250 - 0,5mm / greater than 250 - 1mm

STANDARD AND SPECIAL TESTS

All MarelliMotori products are subject to routine tests carried out in accordance with CEI/IEC standards. The following additional tests can also be carried out on request

Additional Test	<p>Basic</p> <ul style="list-style-type: none"> • Measurement of winding resistance (cold). • High voltage test plus insulation resistances immediately before and after the test. • Dielectric test. • No load test.
	<p>Complete (= Basic +)</p> <ul style="list-style-type: none"> • Locked rotor test. • Full load winding temperature with method by resistance variation. • Determination of efficiency and power factor at $\frac{1}{4}$, $\frac{2}{4}$ and $\frac{3}{4}$ of load.
Extra Test	<ul style="list-style-type: none"> • On-load test with variable voltage. • Measurement of curve C = f(n). • Measurement of vibration in accordance with IEC 60034-14. • Measurement of noise level, (no load). • Verification of IP protection in accordance with IEC 60034-5.

MOTORS FED BY FREQUENCY CONVERTER

The operating characteristics of the motors described in this section of the catalogue refer to the electrical supply by frequency converter with a commutating frequency higher than 3kHz.

Motors fed by inverter and intended for use in installations in potentially explosive atmospheres must be:

- explicitly requested for this type of supply,
- specifically chosen considering the load and speed range,
- using appropriate passive thermal protection (thermistors, PT100), with connection to suitable supply system protection apparatus.
- given a nameplate identifying: supply characteristics of the frequency converter, torque and speed range.

The maximum supply frequency value is dependent on the frame and polarity of the motor, as shown in the following table.

Frame Size	N° poles	Temperature class T3	Temperature class T4
71 to 400	2	60 Hz	60 Hz
71 to 400	≥ 4	100 Hz	75 Hz

For motors ≥ 4 poles and supply frequency between 75-100 Hz contact MarelliMotori.

The performances of motors fed by frequency converter are given in the specific tables.

EFFECTS OF INVERTER SUPPLY ON THE MOTOR

A motor supplied by a frequency converter (inverter) does not receive a purely sinusoidal feed (voltage, current), which leads to an increase in:

- additional losses,
- noise and vibrations,
- stresses on the electrical insulation,

As well as:

- the production of voltages and currents in the bearings,
- the need to provide additional solutions to satisfy the EMC requirements for the installation.

ADDITIONAL LOSSES

Additional losses increase the heat of the motor, which may lead to an increase in the temperature of the bearings.

These effects must be considered (by using appropriate derating with respect to the supply by the mains), in particular for potentially explosive environments where limits to the maximum surface temperature are applied.

NOISE VIBRATION

The increase in magnetic noise depends mainly on the commutating frequency of the inverter and as well as the harmonic content.

Self-ventilated motors, when running at frequencies higher than the rated value, give an increased noise level due to the increased ventilation. For speed values higher than the rated one, the maximum speed reachable by the motor or the critical speed of the system must not be exceeded.

In this case, the use of separate ventilation is recommended to reduce any possible excessive noise.

EFFECTS ON ELECTRICAL INSULATION

The insulation system in a motor is subjected to an increased dielectric effect when fed by an inverter. Depending on the supply system characteristics, the indications given in the paragraph "Instructions for the correct use of motors fed by frequency converter" must be considered.

GENERATION OF VOLTAGE AND CURRENT IN THE BEARINGS

The inverter induces high frequency voltages into the shaft, possibly causing bearing currents which must be avoided in all motors for potentially explosive atmospheres.

The paragraph "Instructions for the correct use of motors fed by frequency converter" gives the indications which must be followed for the use of insulated bearings / supports or of appropriate filters between the inverter and motor to avoid the risk of current circulation in the bearings.

D5 series motors from 280 to 400 frame size when designed for inverter application, are supplied with insulated N-End bearings.

EMC REQUIREMENTS FOR THE INSTALLATION

The use of cables and connections conforming to EMC (electromagnetic compatibility) recommendations is necessary. Supply cables to the motor must be both shielded and symmetrical. The motor and the driven system must be properly earthed, to avoid possible voltages and currents in the bearings of the motor. The additional instructions given by the inverter manufacturer must also be followed.

INSTRUCTIONS FOR THE CORRECT USE OF MOTORS FED BY FREQUENCY CONVERTER

The type of the inverter and of the filters must be properly selected to guarantee a peak voltage at the motor terminals of less than 1060V.

The following table indicates the solutions to be applied on motors fed by frequency converters. They are classified with respect to the input voltage of the inverter.

Frame Size \ Voltage	$U_N \leq 500V$	$U_N \leq 690V$
≤ 250	Standard insulation	Standard insulation + filter dU/dt (*)
280 ÷ 315	Reinforced insulation + insulated bearing	Reinforced insulation + Insulated bearing + filter dU/dt (*)
355 ÷ 400	Reinforced insulation + insulated bearing	Reinforced insulation + Insulated bearing + filter dU/dt (*) + common mode filter (*)

(*) Not scope of MarelliMotori supply.

SELF-VENTILATED MOTORS

The ventilation in a self-ventilated motor is a function of the speed of the motor itself (and therefore also of the feeding frequency). Consequently the cooling and noise level vary according to the inverter output frequency, thus:

- in the frequency range lower than the rated value, a further power derating must be considered (see the relevant graphs in the dedicated section)
- in the frequency range higher than the rated value, the noise increases approximately by the values given in the following table:

Frequency [Hz]	60	75
Additional noise [dB(A)]	4 - 5	9

MOTORS WITH FORCED VENTILATION

Forced ventilated motors are equipped with an auxiliary motor which must have a classification compatible with the main one. The use of forced ventilation is recommended in the presence of wide range of speed variation and when constant torques are requested. The operation of the main motor must be made dependent to the correct operation of the forced ventilation unit.

For the correct selection of motors fed by inverters, refer to the corresponding specific tables.

Frame size	Forced Ventilated Motor		Force Ventilation Unit	
	ΔI B3 [mm]	ΔI V1 [mm]	Δp [kg]	Type

Table 2

In case of operating frequencies out from the ranges shown in the table above, please proceed as follow.

Quadratic torque

If f_{max} (maximum supply frequency) is ≤ 50 Hz and the minimum supply frequency f_{min} is ≥ 5 Hz, the available outputs remain those shown in tables 1 and 2 respectively for temperature class T3 (or maximum surface temperature T150°C) or T4 (T135°C).

Constant torque

- By applying to the curve 1 or 2 given in the previous page, and depending on the class of temperature or the maximum surface temperature, calculate the K_c value relate to frequency variation's limits, and take into consideration the lower only in case of IC411, or that one at the max frequency as for IC416.
- In order to get the T_m value (maximum torque of the motor), multiply the K_c value by the T_n value of the quadratic torque's column within the class of temperature and/or max surface temperature (table 1 or table 2).
- The following formulas are to be applied to calculate the nominal power P_n and current I_n at 400V 50Hz.

$$P'_n = P_n \times \frac{T_m}{T_n} \text{ [kW]} \quad I'_n = I_n \times \frac{T_m}{T_n} \text{ [A]}$$

Table 4

In case of operating frequencies out from the ranges shown in the table above, please proceed as follow.

Quadratic torque

If f_{max} (maximum supply frequency) is ≤ 50 Hz and the minimum supply frequency f_{min} is ≥ 5 Hz, the available outputs remain those shown in tables 3 and 4 respectively for temperature class T3 (or maximum surface temperature T150°C) or T4 (T135°C).

Constant torque

- By applying to the curve 3 or 4 given in the previous page, and depending on the class of temperature or the maximum surface temperature, calculate the K_c value relate to frequency variation's limits, and take into consideration the lower only in case of IC411, or that one at the max frequency as for IC416.
- In order to get the T_m value (maximum torque of the motor), multiply the K_c value by the T_n value of the quadratic torque's column within the class of temperature and/or max surface temperature (table 3 or table 4).
- The following formulas are to be applied to calculate the nominal power P_n and current I_n at 400V 50Hz.

$$P'_n = P_n \times \frac{T_m}{T_n} \text{ [kW]} \quad I'_n = I_n \times \frac{T_m}{T_n} \text{ [A]}$$

Table 6

In case of operating frequencies out from the ranges shown in the table above, please proceed as follow.

Quadratic torque

If f_{max} (maximum supply frequency) is $\leq 50\text{Hz}$ and the minimum supply frequency f_{min} is $\geq 5\text{Hz}$, the available outputs remain those shown in tables 5 and 6 respectively for temperature class T3 (or maximum surface temperature $T150^\circ\text{C}$) or T4 ($T135^\circ\text{C}$).

Constant torque

- By applying to the curve 5 or 6 given in the previous page, and depending on the class of temperature or the maximum surface temperature, calculate the K_c value relate to frequency variation's limits, and take into consideration the lower only in case of IC411, or that one at the max frequency as for IC416.
- In order to get the T_m value (maximum torque of the motor), multiply the K_c value by the T_n value of the quadratic torque's column within the class of temperature and/or max surface temperature (table 5 or table 6).
- The following formulas are to be applied to calculate the nominal power P_n and current I_n at 400V 50Hz.

$$P'_n = P_n \times \frac{T_m}{T_n} \text{ [kW]} \quad I'_n = I_n \times \frac{T_m}{T_n} \text{ [A]}$$

Table 8

In case of operating frequencies out from the ranges shown in the table above, please proceed as follow.

Quadratic torque

If f_{max} (maximum supply frequency) is ≤ 50 Hz and the minimum supply frequency f_{min} is ≥ 5 Hz, the available outputs remain those shown in tables 7 and 8 respectively for temperature class T3 (or maximum surface temperature T150°C) or T4 (T135°C).

Constant torque

- By applying to the curve 7 or 8 given in the previous page, and depending on the class of temperature or the maximum surface temperature, calculate the K_c value relate to frequency variation's limits, and take into consideration the lower only in case of IC411, or that one at the max frequency as for IC416.
- In order to get the T_m value (maximum torque of the motor), multiply the K_c value by the T_n value of the quadratic torque's column within the class of temperature and/or max surface temperature (table 7 or table 8).
- The following formulas are to be applied to calculate the nominal power P_n and current I_n at 400V 50Hz.

$$P'_n = P_n \times \frac{T_m}{T_n} \text{ [kW]} \quad I'_n = I_n \times \frac{T_m}{T_n} \text{ [A]}$$
